

CAT4 Release notes 4.2 May 2016

This upgrade contains:

CAT Plus Prompts are available from Daily CAT view. Refer to the [User Guides](#) for functional details. This functionality requires Topbar version 1.6 or greater to be installed.

CAT4 allows you to identify groups of patients at risk or of interest and create a notification rule.

The rule is recognised in Topbar when the patient record is opened in the clinical system and the patient meets the notification rule criteria.

The notification informs the clinician of any follow up activities required and the reason the criteria has been matched.

This functionality enables the practice to ensure that opportunistic care is given based on the patients' needs.
