# Cross Tabulation - Next Level Reporting

Cross tabulation allows the combination of filters and multiple report tabs. This can be used to identify patients with specific results only (high level HbA1C for example) or to add more information to a report (number of visits). This recipe section has some examples for using cross tabulated reports to refine your results and give you new information in one simple table. Please refer to the full guide on cross tabulation for details: Cross Tabulation Report

- Adding Provider Details to a Report
- Finding patients at risk of diabetes
- Find patients eligible for GPMP/TCA - cross tabulated
- Identify outstanding Diabetes Cycle of Care Items - cross tabulated
